

ABSTRACT

The agricultural machine comprises a body (4) which at least partially rests on the ground. Said body (4) can be hitched to a tractor vehicle (3) by means of at least one link defining a first pivoting axle directed upwards; a second pivoting axle which is substantially horizontal is directed according to a direction of advancement (2) of said agricultural machine, and a third pivoting axis which is substantially horizontal is directed across the direction of advancement (2). The agricultural machine is characterized by the fact that it comprises an adapter (25) firmly connected to a hitch bar (24) of said tractor vehicle (3), a support axle, and at least one jaw comprising an opening which widens according to a direction which is substantially vertical. During hitching, the support axle is engaged inside said jaw.
